2. Message Definition:

2.1. Introduction:

Dräxlmaier is transmitting VDA4905/4 as a delivery forecast to most of its suppliers. Alternatively EDIFACT DELFOR can be sent.

This document provides the definition of a Delivery Instruction Message, based on the EDIFACT DELFOR D97.A, to be used in Electronic Data Interchange (EDI) between the Dräxlmaier Group and its Trading Partners.

The intention of this document is to describe the Dräxlmaier specific interchange structure. Therefore only segments used by Dräxlmaier are explained and additional standard related documentation might be necessary.

2.2. Generation

There are two occasions initiating the generation of a DELFOR message:

- Weekly release: The sending schedule renews the demand and received shipments of all articles.
- Daily release (conditional): The sending schedule supersedes applicable articles. It only contains articles that have a changed demand since the last forecast message. This schedule is created within 24 hours after the change has been made.

2.3. Function

EDIFACT DELFOR is a message from Dräxlmaier to a supplier giving details for short and long term material requirements in line with the conditions set out in the purchase contract. This message gives authorization to ship the firmed and immediately needed quantities. Furthermore it provides a planning forecast, allowing the supplier to purchase raw materials to cover future requirements.

2.4. Departures from the GM Guideline:

It was necessary to slightly modify the Dräxlmaier EDI from the GM Guideline. Below all departures are listed:

- The accumulation start/reset date of the cumulative quantity received and scheduled is not given in the forecast. Instead a dummy date 2005-01-01 will be transferred.
- The Interchange Control Reference is not the calendar week but a unique number for each DELFOR message.
- A quantity/date expressed in the QTY segment of the Delivery Schedule Detail Section with qualifier 83 is a backorder quantity.
- A quantity/date with qualifier 84 is specifying an urgent demand.
- QTY+83 and QTY+84 are transferred in the segment SCC+10+P2 and both requirements must be delivered as soon as possible.
- Quantities/dates expressed in the QTY segment of the Delivery Schedule Detail Section with qualifier 183 are articles that have no further demand / dropped its demand to zero. If applicable, this information is transmitted in a user-defined SCC segment (SCC+9).
- The IMD-segment might be used two times per article to transfer the part description and its GM-number.
- The flexible interval is not necessarily starting on a Monday and ending on a Sunday. It might display a full or just a part of a calendar month.
- Additionally, the number, date and amount of the last shipment received is given in segment 15 (QTY+48)

3. Message Description

3.1. Segment Table

The segment table illustrates how the segments will be repeated in the Dräxlmaier specific Delivery Forecast. The numbers indicate the maximum occurrences for each segment. Re-occurring segment groups are explained only one time.

| 0 | 1 | 2 | 3 | 4 | 5 | Level |

For a better reading the message has been shown with each segment type on a separate line, which might not be the case when the message is normally transmitted. Depending on the Value-Added-Network used for the transfer the EDI will be generated either with or without line breaks. The next example shows how the message looks like without line breaks.
